

6.3 Navigate Stage

Navigate Stage

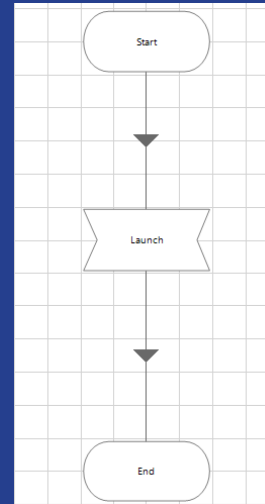

- **Navigate Stages** enable **Actions** to be used to **Launch** and **Close** an application.
- It is best practice to provide ‘**Preconditions**’ and ‘**Postconditions**’ for an Action:
- **Preconditions** should describe the state of the application prior to running the Action.
- **Postconditions** should describe the state of the application once the Action has run (e.g. the application *Log In* window is open on screen).
- **Action Pages** must be published before they become visible in the **Actions** menu, in the **Navigate Stage** properties window.
