

10.1 Release Manager

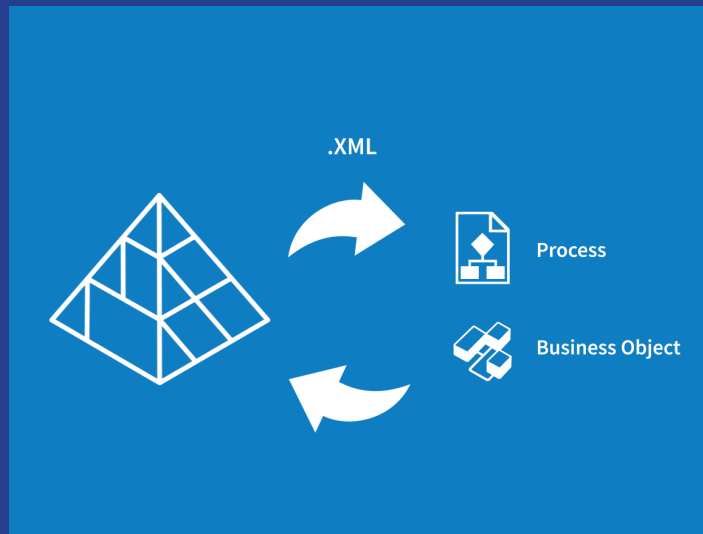

Release Manager

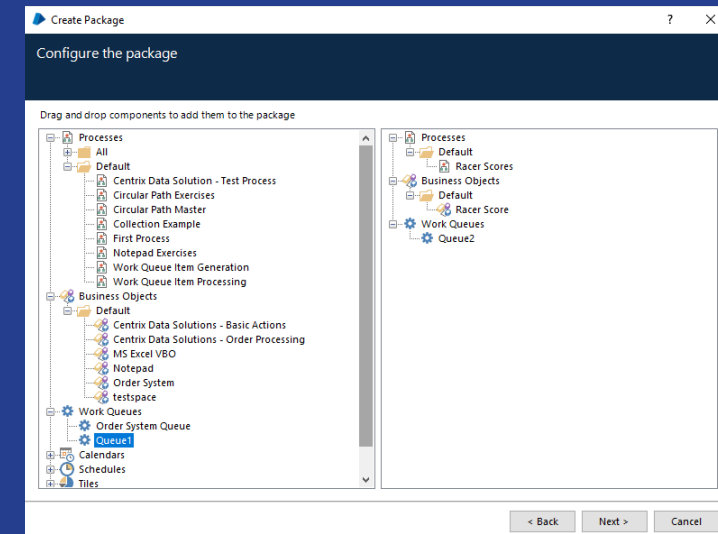

- An individual Process or Business Object can be exported from Blue Prism as an XML file and these exported files can be imported back into Blue Prism. This can be useful for backing up, sharing and moving singular components of a Blue Prism Solution between databases.
- A Blue Prism Solution is a compilation of interconnected Processes, Business Objects and Work Queues and as a result, should always be migrated as a 'Package' or 'Release'.
- Blue Prism Release Manager enables users to compile all of the components of a Blue Prism Solution into a Package. Including not only Processes, Business Objects and Work Queues, but also Schedules, Calendars, Tiles and Dashboards.
- To export a Solution Package a Release must be created by *right-clicking Package Overview* and selecting *New Package*.
- A Release is a snapshot of the state of each of the components within a Package at a particular moment in time. At various stages during the development cycle of a Blue Prism Solution, Releases will be exported and imported across databases.

A Package containing components of a Blue Prism Solution.

Process/Business Object exported as XML.
