

9.2 Queue Items

Queue Items

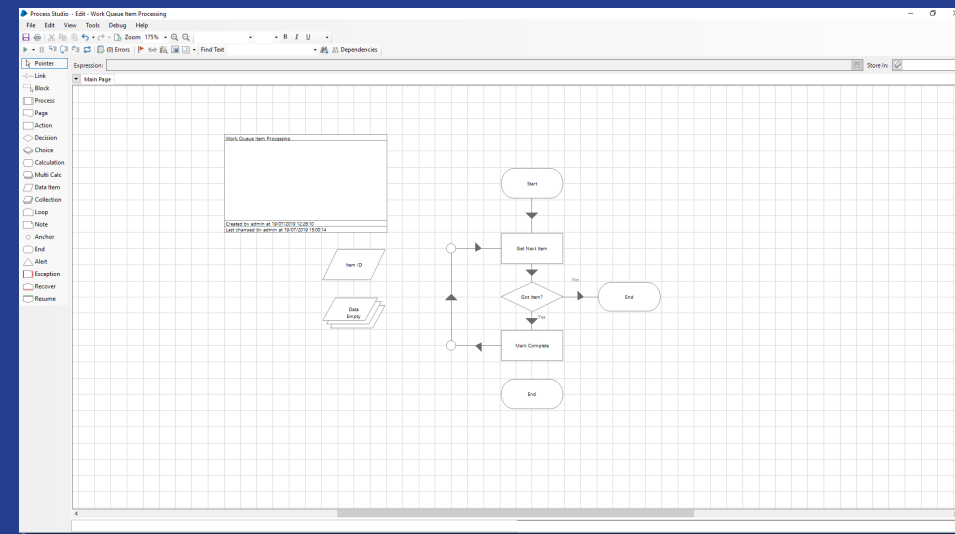

- A Work Queue is populated with Items through a Blue Prism Process, ready to be worked by the same Process or by other Processes.
- To ensure a Process is able to work all of the Items within a Queue, the Process must include a Circular Path to return the flow back up to the *Get Next Item* Action Stage.
- Once all of the Items have been worked and marked as either 'Completed' or as 'Exception', and once the *Get Next Item* Action Stage returns an empty Item ID, then the Process will flow towards the End Stage. An empty Item ID indicates that there are no more pending Items in the Work Queue, due to be worked.

Process inputting data into a Work Queue as Items.

Queue Contents Clear Filters Show Positions in Queue
