

# 2.4 Process Validation

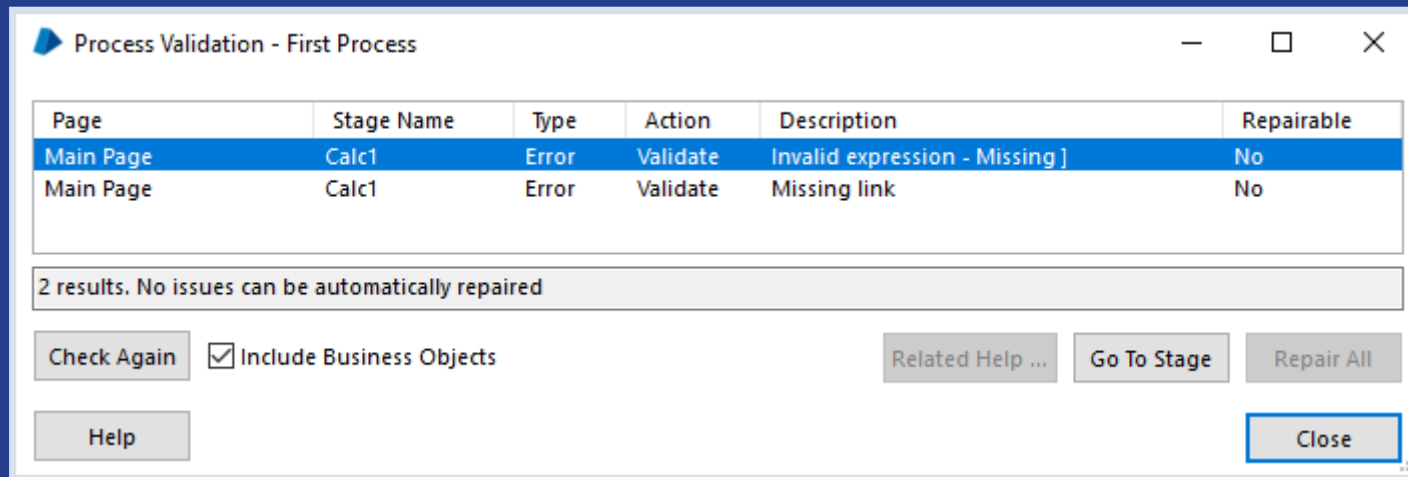

## Process Validation

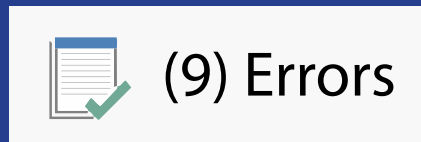

- The Validation button opens the Process Validation window, for diagnosing issues.
- The Validation window categorizes issues as *Error*, *Warning* or *Advice*, identifies the type of action that should be taken to resolve them and whether they are repairable by Blue Prism.
- Validation checks the basic construction of a Process Diagram, but is not capable of analyzing the logic. This responsibility always sits with the user.
- The *Go To Stage* button will highlight the exact Stage that is causing the issue.
- The *Help* button is for troubleshooting issues.
- It is best practice to Validate Process Diagrams at regular intervals, including every time they're saved and closed.

## Key Point

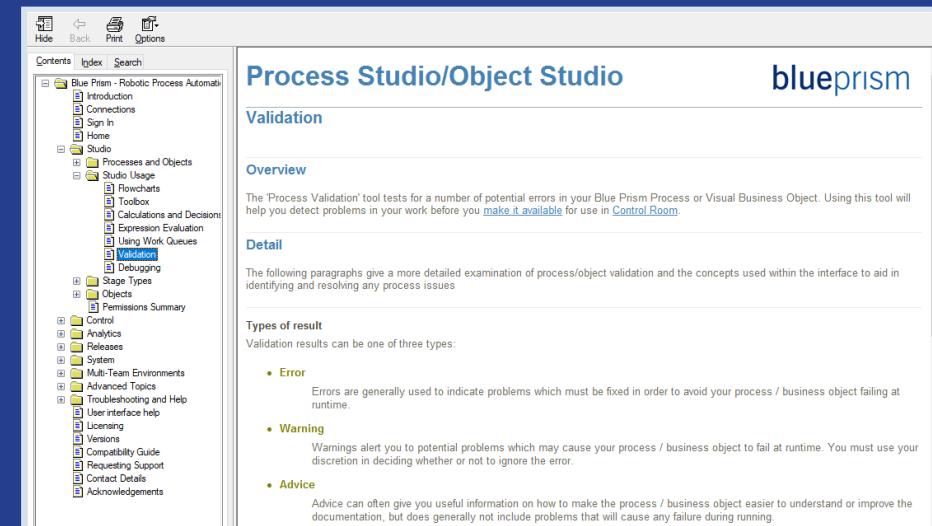

- As your Process Diagram develops and grows in complexity, it becomes increasingly important to check each change, as you make them.
