Blue Prism Tools (Section 4)

Stage Tools

	Page

A Page Reference Stage enables movement between the Pages within a Process Diagram.

	Data Item

A Data Item acts as a placeholder for values.

	Start

A Start Stage can be set up to receive an Input value from a upper Page.

	End

An End Stage can be set up to transmit an Output value to an upper Page.

Stepping and Stages

There are three Step buttons, which can be used to test and execute a Process in different ways.

	Step

Step runs one Stage at a time within a Process.

	Step Out

Step Out can be used on any Stage within a Process to execute the remaining Stages on the current Page, then move back to the upper Page.

	Step Over

Step Over moves past a Page Reference Stage in one step. The logic on the Sub-Page will be executed without the need to step through every Stage on that Page.
